SF6090 100 Amp, 10 Volt Laser Diode Driver Module

LASER DIODE DRIVER MODULE

◊ Up to 100 Amp Output Current

◊ Up to 10 V Compliance Voltage

◊ Soft-Start Current Ramp, Current Limit, Reverse Voltage Protection

◊ NTC Thermistor Input for Laser Over-Temperature Fast Shut-Down

◊ GUI Control Software Included

LASER DIODE DRIVERS

1. Features

- Low current ripple
- No need to adjust voltage
- Soft-start
- Adjustable current limit
- Thermal warning and shutdown
- Reverse current protection
- Crowbar circuit protection
- Universal controls
- NTC thermistor input
- GUI software

2. Applications

- Supplying laser diodes, bars, and arrays
- Supplying high power LED arrays

4. Package set

- Driver – 1 pcs
- 50 cm ribbon cable with one 8-pin connector – 1 pcs
- 50 cm ribbon cable with one 14-pin connector – 1 pcs
- Wires fixing set – 1 pcs
- Datasheet & User Manual – 1 pcs

5. Overall dimensions and weight

The driver has overall dimensions of 61 x 57.9 x 24 mm and a weight of 145 g.

3. Description

The SF6090 is a non-isolated DC/DC SMPS (POL) with constant current output. Driver produces high stability and low ripple current. Protection features include an over current protection with adjustable limit, soft-start, thermal warning and shutdown, reverse current protection and crowbar circuit protection. This means the SF6090 can safely drive nonlinear and current quality sensitive loads like laser diodes and LEDs.

The driver can be controlled by analog or digital signals.

SF6090 is available in thermal enhanced quarter-brick package with aluminum base plate to aid thermal dissipation. Driver can be mounted on any thermal conductive surface enough to dissipate driver losses.

6. Absolute maximum ratings*

	MIN	MAX	UNIT
Vin+ to Vin-	-0.3	15	V
Operating temperature	-40	50	°C
analog control pins to GND	-0.3	5.5	V
RS-232 RXD to GND	-25	25	V
RS-232 TXD to GND	-13.2	13.2	V
UART RXD to GND	-0.3	5.5	V
UART TXD to GND	-0.3	5.5	V

*Stresses beyond those listed under absolute maximum ratings may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under recommended operating conditions. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

7. Recommended operating conditions

	MIN	MAX	UNIT
Input voltage (V$_{in}$)	10	14	V
Operating temperature	-10	40	°C
Analog control pins to GND	0	5	V
RS-232 RXD to GND	-12	12	V
RS-232 TXD to GND	-12	12	V
UART RXD to GND	0	5	V
UART TXD to GND	0	5	V

8. Power supply requirements

The driver requires a DC power supply with line regulation ± 1%. The power supply must be able to cover the driver output power and losses. Nominal input voltage 12V. Recommended power supply: Mean well SE-1000-12.

9. Electrical characteristics

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
OUTPUT					
Output voltage (V$_{out}$)		1		0.75*V$_{in}$	V
Output current (I$_{out}$)		0		100	A
Current ripple			20	50	mA
Pulse rate (F)	QCW-mode	0.1		100	Hz
Pulse duration	Set by RS-232 or UART	2	1/F - 2	5000	ms
	Set by analog pin	0.5		1/F	
Rise time (Soft-start time)	I$_{out}$ = 100A	150	200	300	us
	I$_{out}$ = 50A	120	250	400	us
Fall-time (Stop time)		250	350	500	us
Error-triggered fall-time (Stop time)		3	40	60	
Output capacitance			150		uF

INPUT					
Vin quiescent current		60	80	100	mA
Input capacitance			2300		uF

CONTROLS					
Enable pin low threshold				1	V
Enable pin high threshold		2.3			V
Interlock pin threshold				1	V
Interlock pin pull-up resistance			10		kΩ
Current set pin voltage vs. output current			20		A/V
Current set step	Set by RS-232 or UART		0.03		A
Current set accuracy[1]	30A < I$_{out}$ < 75A		+/- 5		%
	75A < I$_{out}$ < 100A		+/- 1		%
Current set calibration		- 5		+ 5	%

12. Pin and terminal functions

Please note input and output polarity.

Never ground any lead of the output; permanent damage to the laser diode and driver may result. Never use any grounded probes (e.g. from the oscilloscope) at the output: the control pins are not isolated.

Terminals

	Terminal	Description
Please, pay attention to the markings!	Vin+	Connect to the positive terminal of the power supply. **NOTE POLARITY**
	Vin-	Connect to the negative terminal of the power supply. **NOTE POLARITY**
	LD+	Connect to the laser diode anode. **NOTE POLARITY** **Grounding this terminal may cause permanent damage to the driver.**
	LD-	Connect to the laser diode cathode. **NOTE POLARITY** **Grounding this terminal may cause permanent damage to the laser diode.**

Controls

	№	Description
	1	Analog control connector
	2	Current limit adjustment potentiometer (adjustment from zero to maximum occurs in 12 turns)

Pin	Description
1	UART RXD
2	RS-232 RXD
3	UART TXD
4	RS-232 TXD
5	+5V auxiliary (duplicates pin 4 of analog control connector)
6	Interlock (duplicates pin 5 of analog control connector)
7	Crowbar status (duplicates pin 3 of analog control connector)
8	**GND** (connected to Vin- terminal)

Analog control connector

Wurth WR-MM 6901 5700 14 72 or TE Connectivity 1-215083-4

PIN	I/O	Name	Description
1	I	Enable	High = operates; Low = stop. Internally pulled down. TTL or CMOS signals only.
2		**GND**	Connected to Vin- terminal.
3	O	Crowbar status	High = fault; Low = normal operation. Internally pulled down.
4		+5V	Auxiliary +5V power supply. Up to 200mA output current capability.
5	I	Interlock	Open = locked; Low = operates. Internally pulled up.
6	O	Over-temperature warning	High = t° > 67°C; Low = t° < 65°C. Internally pulled down.
7		**GND**	Connected to Vin- terminal.
8		-15V	Auxiliary -15V power supply. Up to 20mA output current capability.
9	O	Voltage monitor	0-10V = 0-10V at the output.
10		+15V	Auxiliary +15V power supply. Up to 20mA output current capability.
11	O	Current monitor	0-5V = 0-100A at the output.
12		**GND**	Connected to Vin- terminal.
13	I	Current set	0-5V = 0-100A at the output.
14		NTC Interlock	Connect NTC thermistor 10k between this pin and GND.

13. Analog control description

Enable

The enable pin is active high 3.3V and 5V compatible logic input. Driver operates when enable pin is high. To ensure correct start-up without overshoot, the soft-start sequence initiates when the enable pin becomes high.

The enable pin can be used for QCW operation. The output may be pulsed by applying a TTL square signal to enable pin.

Crowbar status

Crowbar status pin reports the status of the protection shorting crowbar clamp across the output. The crowbar will short the output while over-current shutdown and over-temperature shutdown. During protection shutdown the enable pin is ignored. Disconnect the driver from power to reset the protection status.

Interlock

The Interlock pin must be connected to GND in order for output current to be delivered. It can be used for external interlock e.g. safety door or over-temperature switches.

Over temperature warning

When the temperature of driver PCB exceeds 60°C the over-temperature warning will go high to indicate driver is in danger of shutting down due to over-temperature condition. When temperature of driver PCB exceeds 80°C, the driver will shut down. The driver can be restarted when the temperature drops to 58°C.

Voltage monitor

The output voltage of the driver can be monitored by voltage monitor. 0-10V = 0-10V with ±2% accuracy. The voltage is measured between LD+ terminal and GND.

Current monitor

The output current of the driver can be monitored by current monitor. 0-5V = 0-100A with ±2% accuracy.

Current set

The driver output current is set by applying an analog signal to the current set pin. 0-5V = 0-100A.

The current set pin can be used for analog modulation by applying sin, square, or ramp signal with the DC component. analog modulation amplitude depends on frequency. Use caution to avoid over-driving the laser when using the current set with a modulation source.
If you use arbitrary/function generator or lab PS for current set, make sure it is in High-Z mode. Configure the modulation input using a high-current diode dummy load (eg. Schottky).

NTC Interlock

Thermistor connection. Allows you to measure the temperature of a laser or other devices. The measurement result is readable by the digital interface. Set upper and lower limits of the temperature protection circuit using software. The driver shuts down if the temperature falls outside the limits set by the user; operation can be resumed with the temperature is within the programmed limits.

11

670 South Ferguson
Bozeman, MT 59718

14. How to get started

1. Unpack the driver;
2. Connect a dummy load (e.g. a Schottky diode) to the LD- and LD+ terminals. Please note polarity;
3. Connect the controls (analog and/or digital);
4. Connect the power supply. Please note polarity;
5. Rotate the current limit potentiometer clockwise several times;
6. Turn on the power supply;
7. Set the current equal to the desired current limit threshold;
8. Enable the driver;
9. Rotate the potentiometer counter-clockwise slowly while the crowbar status pin becomes high;
10. Restart the power supply to reset protection;
11. Make sure the over-current protection limit is set right;
12. Make sure that all controls are working;
13. Turn off the power supply and disconnect a dummy load;
14. Connect the laser diode to the LD- and LD+ terminals. Please note polarity.

15. Cooling

The driver produces up to 50W of losses. Thus the base plate has to be mounted on a thermal conduction surface to ensure proper operation and prevent an over-temperature shutdown. If the conduction cooling is not enough an additional cooling may be achieved by placing the driver into the airflow of a fan.

16. Internal protections

Several security features protect the laser diode and driver from damage. Reverse diode protects the laser diode from reverse currents. In case of an over-current or an over temperature condition, the control logic disables the driver and the output shorts by a crowbar clamp. A soft-start mechanism slowly raises the current at startup to protect the laser diode against current overshooting.

17. Software

We offer GUI software to control driver. Email is us or contact us via the Contact form on our webste: www.LaserDiodeControl.com.

18. Digital control description

When the input voltage applied, the driver is always in "analogue current set, external enable and allowing interlock" state. Any other state should be set any time after powering the driver if needed.

Default serial port settings:

Baud rate	Data bits	Stop bits	Parity	Flow control
115200	8	1	none	none

www.LaserDiodeSource.com
www.LaserDiodeControl.com
part of the **Laser Lab Source Group**

800-887-5065

12

670 South Ferguson
Bozeman, MT 59718

Data exchange between the driver and the PC is only initiated by the PC. All commands are sent in plain text format. All commands are sent with prefix. Number of command follows the prefix without any symbols. If there is the value after the command they separates with "space" symbol. The command ends with "carriage return" symbol.

The format of the command to set the value (P-type);

Number of byte	Value	Comment
1	P (50h)	Set prefix
2-5	Number of the parameter	Hex-number of the parameter. For example, 0100h
6	'space' symbol (20h)	
7-10	New value of the parameter	Hex-value of the parameter. For example, 0000h
11	'return carriage' symbol<CR> (0Dh)	End of the command

The device does not respond to P-type commands by default. (see section "the protocol extension")

You can request the value of parameter by the J-type command. The device will return a value of requested parameter.

The format of the command to get the value (J-type)

Number of byte	Value	Comment
1	J (4Ah)	Request prefix
2-5	Number of the parameter	Hex-number of the parameter. For example, 0100h
6	'return carriage' symbol<CR> (0Dh)	End of the command

The format of the response

Number of byte	Value	Comment
1	K (4Bh)	Response prefix
2-5	Number of the parameter	Hex-number of the requested parameter
6	'space' symbol (20h)	
7-10	Returned value of the parameter	Hex-value of the parameter
11	'return carriage' symbol<CR> (0Dh)	End of the command

If the device could not recognize a command, it returns an error message with error code.

The format and codes of errors

Error (returned command)	Reasons (one or few)
E0000	1) Internal buffer of device is overflowed. 2) Cannot find <CR> (0x0D) or\and <LF> (0x0A). 3) Format of command is invalid.
E0001	1) Unknown command (it does not P- or J-type command). 2) The device failed to correctly interpret a command.
E0002	The CRC of received command (see section "the protocol extension").
K0000 0000	Request or set the parameter that does not exist.

PCB temperature (0.1°)	Measured value		R	0AF4

*If temperature of the device reaches the over temperature warning threshold the overheat flag will be set. If the device is in over temperature protection state, then overheat and over current flags are set together.

Examples

1) For the current value parameter, 0300:

To request value, send the following command:

"J0300" in text or "4a 30 33 30 30 0d" in hex.

Answer will be:

"4b 30 33 30 30 20 30 33 45 38 0d" in hex, "K0300 03E8" in text, 03E8h > 1000 in dec > 10.00 A.

To set new value, for example, 13.5A (0546 in hex), send the following command:

"P0300 0546" in text or "50 30 33 30 30 20 30 35 34 36 0d" in hex.

2) For the state of the device, 0700:

To request value, send the following command:

"J0700" in text or "4a 30 37 30 30 0d" in hex.

Answer will be:

"4b 30 37 30 30 20 30 30 44 35 0d" in hex, "K0700 00D5" in text, 00D5h > 11010101 in bin > Device is powered on, stopped, internal current set, internal enable, denied external NTC Interlock, denied Interlock.

To set new state, for example, allow Interlock, send the following command:

"P0700 1000" in text, "50 30 37 30 30 20 31 30 30 30 0d" in hex.

3) Errors:

If a command with the wrong parameter number was sent, answer will be "K0000 0000" ("4b 30 30 30 30 20 30 30 30 30 0d").

If a command with the wrong format was sent, answer will be an error "E0001" ("45 30 30 30 31 0d").

15

670 South Ferguson
Bozeman, MT 59718

Figure 8 – Screenshot from the Termite terminal with commands and answers

The maximum duration depends on the set value of the frequency. When you change frequency, a new value of the maximum duration is computed automatically. The duration of pulse cannot be less than 2 ms and more than period of frequency minus 2 ms. For low frequencies the duration cannot be more than 5000 ms.

Set the zero frequency to switch the device into CW mode or set non-zero frequency value to switch the device into QCW (long pulses) mode. If you try to set a value more or less than limits, then the value will be rounded to limit. Any attempts to set a new state of the device, except "start", will switch the device to the state "stop". Some states of the device are mutually exclusive, for example, if you set "Ext. Enable", then you will not be able to set the state "start". If you send "start" and "stop" commands in sequence, the device will save all parameters in the internal memory. The saving process lasts about 300 ms. In this time the device does not respond to any actions. The device is able to save these parameters in the internal memory:

- Frequency with limits;
- Duration with limits;
- Current with limits and calibration;
- Temperature limits and $B_{25/100}$;
- Settings of the RS protocol extension (see section «the protocol extension»).

19. Digital control description (extended)

WARNING! *Extended protocol recommend for advanced users only. In addition, it might be used for integration of the device with other devices.*

Use the parameter number 0704h for configure the extended protocol. In extended protocol, you can enable and disable the next options: checksum (CRC 8-bit CCITT), return a new value of parameter after P-type commands, change baud-rate, change protocol-mode (text-plain or binary).

The description of the protocol extension command

Action			R\W	HEX-number of parameters
Information about the extended protocol	0 bit	1 – the device supports this option	R	0704
	1st bit	Checksum (1 – on, 0 – off)		
	2nd bit	Return a new value for P-type commands (1 – on, 0 – off)		
	3-5 bits	Baud - rate 0 – 2400 1 – 9600 2 – 10417 3 – 19200 4 – 57600 5 – 115200 (default)		
	6th bit	Data exchange mode (1 – binary, 0 –text-plain)		
Configuring of the extended protocol	On checksum (CS)	0002h[3]	W	0704
	Off checksum	0004h[3]		
	Return a new value for P-type commands	0008h[3]		
	Do not return answer for P-type commands	0010h[3]		
	Set new baud-rate(baud)[4]	0100h – 2400 0120h – 9600 0140h – 10417 0160h – 19200 0180h – 57600 01A0h – 115200		
	Binary mode on[5]	0200h		
	Text-plain mode on	0400h		

---

[3] In binary mode the specified commands are ignored by the device
[4] Here are binary numbers
[5] For more information, see section "binary mode"

800-887-5065

17

670 South Ferguson
Bozeman, MT 59718

Text-plain mode

All commands in text-plain mode should be in ASCII.

WARNING! *If you enable the checksum it will change format of commands. After <CR> symbol you will be write 2 bytes of checksum and last byte will be <LF> (0Ah – "new line" symbol). Checksum is computed for all bytes of command before checksum bytes (including<CR> symbol).*

All answers of the device will also contain a checksum, including K-type and E-type answers. Checksum is computed by CRC-CCITT-8 algorithm. This is the main difference between the format of commands for the extended protocol and standard protocol.

The format of commands for enabled checksum

Number of byte	Value	Comment
1	P,J,K,E	Type of command
2-5	Number of parameter	Hex-number of value
6	'space' symbol (20h)	*(does not use for J and E-type commands)*
7-10	New value of the parameter	Hex-value of parameter *(does not use for J and E-type commands)*
11	'return carriage' symbol<CR> (0Dh)	End of value
12-13	Checksum	CRC checksum of the first 11 bytes *(for J and E-type commands checksum is computed for the first 6 bytes)*, including <CR> symbol.
14	'new line' symbol<LF> (0Ah)	End of command

Possible problems

1. The device waiting for symbol <LF>. If <LF> symbol does not received and buffer is overflowed, then all symbols after overload will be processed as a new command. The device returns an error. In this case, it is recommended to send the <LF> symbol. The device will generate an error and clear the buffer for the next command.
2. All symbols after the <LF> symbol will be processed as a new command.

Binary mode

The binary mode has a significant difference. In this mode, data are exchanged in binary form. Length of any type of command is 8 bytes. In this mode, next options are <u>always enable</u> and you cannot disable it: return a new value of parameter for P-type commands and checksum. The format of binary mode commands is represented in table 8.

The format of binary mode commands

Number of byte	Value	Comment
1	Type of command	50h (P - ascii) – Set a new value of parameter 4Ah (J - ascii) – Get a value of parameter 4Bh (K - ascii) – Answer of the device 45h (E - ascii) – Error
2-3	Number of parameter	Hex-number of parameter
4-5	Value of parameter	Hex-value of parameter. This value is **STRICTLY REQUIRED** in the binary mode. If this value does not make sense, it will be returned as 0000 (K or E-type commands) or you should set it field to any value (for P or J-type commands).
6	'return carriage' symbol <CR> (0Dh)	End of value
7	Checksum	CRC checksum of the first 11 bytes *(for J and E-type commands checksum is computed for the first 6 bytes)*, including <CR> symbol.
8	'new line' symbol <LF> (0Ah)	End of command

20. Mechanical dimensions

All dimensions are in millimeters. Contact us using the Contact form on the website at www.LaserDiodeControl.com.
21. Warranty

In compliance with the provisions of Conditions limited warranty the Buyer has the right to guarantee during the one year period. The warranty period comes into effect from the shipping date.

The warranty only concerns products that are applied according requirements and for the applications specified in the manual for the product. If you want to use the products for other applications, contact us to discuss the implications to the warranty. This warranty does not apply to damage due to incorrect use, abnormal use, or use in violation of product manual.

PRODUCT WARRANTY:

This product is sold with a full one year warranty. It is warrantied to be free from defects in material and/or workmanship for a period of one year from the date of shipment. The warranty does not include damage to the product due to customer mishandling or use of the product outside of its specified maximum ratings.
