Thermoelectric Cooling Temperature Controller   **TEC-1167**
TEC Controller / Peltier Driver up to ±25 A / up to ±56 V   HW v1.20

Two Channel OEM TEC Controller

Description:

The TEC-1167 is a specialized dual channel TEC Controller/power supply able to precision-drive two Peltier elements.

• Each channel features a true bipolar DC current source for cooling / heating, three temperature monitoring inputs (1x high resolution, 2x low resolution) and intelligent PID control with auto tuning. The TEC-1167 is fully digitally controlled, it's hard- and firmware offer numerous communication and safety options.
• The included PC-Software allows configuration, control, monitoring and live diagnosis of the TEC Controller via USB, RS232 TTL and RS485. All parameters are saved to non-volatile memory. Saving can be disabled for bus operation.
• For the most straightforward applications, only a power supply, a Peltier element and at least one temperature sensor need to be connected to the TEC-1167 After power-up the unit will operate according to pre-configured values. (In stand-alone mode no control interface is needed.)
• The TEC-1167 can handle either Pt100, Pt1000, NTC or Voltage temperature probes. For highest precision and stability applications a Pt100 / 4-wire input configuration is recommended. Analog measurement circuit is factory calibrated.
• Auxiliary temperature inputs allow the connection of NTC probes that are located on the heat sinks of the Peltier elements. This additional data is used to compensate for parasitic thermal conduction of Peltier elements. Also, it allows the control of external heat sink cooling fans.

• The heating and cooling power is optimized by proprietary thermal management routines based on power balance models (for Peltier elements and resistive heaters).
• Further functionality includes: Smooth temperature ramping, thermal stability indication and auto gain (NTC probes). The PC-Software allows data logging and configuration import/export.

Operation-Modes / Theory of Operation

The TEC-1167 is an OEM precision TEC Controller that is available with Terminal Blocks and with connectors. Its basic operation status is visually indicated by on-board green and red LEDs and their blinking pattern.
CON locking Connector equipped version
(Best suited for series production)

TB Terminal Block equipped version
(Best suited for prototyping, commissioning and small series.
**Attention**: Counter parts for Terminal Blocks will not be shipped with the device!)

Status information can be polled at any time by industry standard connections RS485, RS232 TTL, CANopen or by USB. The TEC-1167 can also operate in a remotely controlled manner, with parameters adjusted on the fly. The TEC Controller has Scripting capability by sequential lookup table read-out.

Configured as a DC power-supply, the TEC-1167 can handle current and voltage settings. In the remote-control case, temperature data may be passed on to be processed by the host.

Configurable parameters further include sensor linearization (Pt100 / Pt1000) and Steinhart-Hart modeling (NTC), temperature acquisition hardware calibration, Peltier element modeling, PID controller auto tuning, nominal temperature ramping, current, voltage and temperature limits, error thresholds, etc. Please refer to the TEC Controller User Manual (Document 5216) for further information.
